

# Symmetrics Opens Tysons Corner, VA, Headquarters at the Center of America's Tech, Cybersecurity, and Policy Ecosystem

Symmetrics, a cybersecurity company focused on delivering quantum-secure encryption, has established its new headquarters in Tysons Corner, Virginia, at the intersection of the nation's tech, national security, and policy landscapes.

**Tysons Corner, Virginia Apr 14, 2026 ([IssueWire.com](https://www.IssueWire.com))** - Symmetrics, a cybersecurity company focused on delivering quantum-secure encryption, today announced the opening of its headquarters in Tysons Corner, Virginia. The move places the company in one of the National Capital Region's most important business and technology corridors, close to major enterprises, cloud and cybersecurity leaders, the national security community, and policymakers shaping the future of digital infrastructure. Symmetrics' website positions the company around one-time pad symmetric key encryption at scale for the first time in the world, perfect secrecy, continuous key delivery, and quantum-secure protection for banking, healthcare, gaming, cloud and SaaS infrastructure, and the national security community.

Tysons and the broader Northern Virginia region continue to stand out as a strategic hub for advanced technology and cybersecurity growth. Fairfax County's economic development authority says the Washington region ranked as the **#1 Tech Hub in North America** in Site Selection's inaugural North American Tech Hubs Index, and describes Northern Virginia as a magnet for cloud, AI, cybersecurity, and high-growth technology companies. Recent expansion announcements across several industries reinforce the area's role as a center for commercial innovation and government-adjacent technology activity.

"Opening our headquarters in Tysons Corner marks an important step in Symmetrics' next phase of growth," said **Walter Raquet, Chair and CEO** of Symmetrics. "This region sits at the intersection of enterprise technology, national security, and public policy. It is the right place for us to deepen strategic relationships, support customers and partners, and help organizations prepare for the post-quantum era of encryption."

Symmetrics' platform is designed to replace vulnerable public-key assumptions with a patented symmetric-key delivery model built for modern digital environments. The company currently highlights products spanning its capability of sending **one-time-use symmetric keys over the internet**; Symmetrics quantum-secure VPN; and Authentication & Access Management offering, with use cases focused on protecting data in motion, data at rest, APIs, microservices, user sessions, and access

environments.

The headquarters opening supports Symmatrics' continued growth in the US market and its efforts to engage enterprise customers, strategic partners, investors, and public sector stakeholders seeking stronger security architectures for the quantum era. The announcement also aligns with World Quantum Day on 14 April, an annual international awareness day dedicated to quantum science and technology.

### **About Symmatrics**

Symmatrics is an encryption company focused on raising the standard of post-quantum cryptography and cybersecurity for high-risk digital environments. According to its website, Symmatrics delivers one-time symmetric keys for mathematically-unbreakable, quantum-secure encryption at a global scale via the internet for the first time in the world. Using one-time pad true symmetric keys, and a patented continuous key delivery model, the platform is designed to provide a minimal AI attack surface, quantum-secure protection across cloud infrastructure, VPN, authentication, and other security-critical systems.
