

# Telecom Operators Gain Edge Over Tech Giants with Digital Tide's New White-Label Corporate Messenger

Moving out of beta, Digital Tide's latest application empowers ISPs and MNOs to deploy a fully branded, zero-CAPEX communication tool combining VoIP and team chat.

**Dubai, United Arab Emirates Apr 17, 2026 (IssueWire.com)** - To help regional telecommunications providers compete in the enterprise sector, Digital Tide has officially launched its white-label Corporate Messenger. The application, which seamlessly merges VoIP business calling and internal team messaging, is now available for deployment by Mobile Network Operators (MNOs) and ISPs globally.

As businesses increasingly rely on third-party collaboration tools like Slack and Microsoft Teams, regional telecom operators are missing out on critical B2B revenue. The Digital Tide Corporate Messenger allows operators to reclaim this market by offering a comprehensive, unified communications package directly to their corporate clients under their own brand.

"Operators can no longer rely solely on basic voice routing to retain enterprise clients," said Aleksejs Beļakovs, CEO of Digital Tide. "By integrating a fully branded corporate messenger into our zero CAPEX platform, we are giving regional telecom providers the exact tools they need to compete with global tech giants and increase their average revenue per user."

The new messenger is designed for frictionless adoption. End users can download the application directly from their PBX welcome email, their user profile interface, or through dedicated knowledge base articles.

Because the Digital Tide ecosystem is built on a pure revenue-sharing model, partners can launch this enterprise application immediately without the burden of upfront development costs or heavy infrastructure investments. Telecom operators retain complete ownership of their customer base while Digital Tide secures the backend cloud architecture.
