

## Crypto Payments Set to Reshape the Global Hospitality Industry — PEYMO Positioned at the Center of the Shift

Single-API integration lets hospitality merchants accept card or cryptocurrency at checkout and settle in either fiat or crypt

**London, United Kingdom May 11, 2026** ([Issuewire.com](http://Issuewire.com)) - The global hospitality industry is entering a major technological transformation as hotels, booking platforms, and travel operators increasingly explore how cryptocurrency payments can become part of the modern guest experience.

What was once viewed as a niche payment method is now emerging as a serious commercial opportunity for the travel sector, driven by the rapid growth of digital assets and the increasing demand for more flexible global payment solutions.

[PEYMO](#), the AI-powered hybrid banking and crypto payments platform, confirms that it has been engaged in discussions with hospitality industry participants regarding potential future implementations of crypto payment infrastructure across hotel bookings, in-property payments, and hospitality services.

The growing interest reflects a broader market shift where hotels are not only looking to innovate, but also seeking practical ways to attract a rapidly expanding global crypto audience — now estimated at more than 580 million users worldwide.

## **Hospitality Looking Toward the Next Generation of Payments**

For hotels and booking platforms, accepting crypto is no longer simply about innovation or marketing value.

The hospitality sector increasingly sees digital assets as a way to:

- Reach international customers more efficiently
- Reduce cross-border payment friction
- Offer additional payment flexibility at checkout
- Attract younger digital-first travellers
- Enable faster settlement and global accessibility
- Reduce dependency on legacy banking infrastructure
- Position themselves at the forefront of financial innovation

Many operators also recognize that a growing number of consumers already hold digital assets and are actively looking for seamless ways to spend them in real-world environments.

## **From Hotel Booking to In-Hotel Spending**

Unlike many existing crypto payment providers focused only on online checkout, PEYMO's infrastructure is designed to support the entire hospitality payment journey.

The platform's technology can potentially enable guests to:

- Book hotel rooms online
- Pay directly at reception
- Purchase food and beverages
- Pay for spa, wellness, and premium services
- Pay in bars, restaurants, and hotel shops
- Send digital tips
- Make international payments without traditional banking friction

Through a streamlined API integration, hotel groups and booking platforms could integrate PEYMO's crypto checkout technology directly into their existing payment flow.

At checkout, customers could simply choose between:

- Pay by Card  
or
- Pay with Crypto

From the consumer perspective, the process is designed to feel familiar, simple, and instant.

Behind the scenes, PEYMO's infrastructure manages the complexity automatically.

Merchants can choose whether they wish to receive settlement in cryptocurrency or traditional fiat currency. If fiat settlement is preferred, the crypto payment can be converted automatically in real time at market rate, allowing the merchant experience to remain operationally similar to a traditional card transaction.

For the merchant, the payment arrives in fiat.

For the customer, crypto becomes instantly spendable in the real world.

This removes one of the largest historical barriers to merchant crypto adoption — volatility and settlement complexity — while simultaneously unlocking access to a rapidly growing global customer base.

### **Why Hospitality May Become One of Crypto's Biggest Use Cases**

The travel and hospitality industry represents one of the largest untapped opportunities in digital payments.

Every year, billions in hotel reservations move through intermediaries, FX conversion systems, payment gateways, and legacy banking networks that often introduce delays, chargeback exposure, geographic limitations, and unnecessary complexity.

Blockchain-powered payment infrastructure and stablecoin settlements have the potential to significantly streamline this process while creating a more global and frictionless payment environment.

### **Industry momentum is already accelerating.**

Major financial institutions and payment providers are increasingly embracing blockchain infrastructure, stablecoins, and embedded finance technologies, while merchants continue searching for more flexible and globally accessible payment solutions.

PEYMO believes hospitality could emerge as one of the defining sectors for mainstream crypto adoption due to its international customer base and constant focus on customer experience innovation.

### **Bridging Crypto Ownership With Everyday Spending**

By combining embedded finance, AI-powered payment technology, crypto spending capability, fiat infrastructure, and merchant-focused tools, PEYMO is building toward a future where paying with digital assets becomes as effortless as using a traditional debit or credit card.

*"This is a natural fit for the future of global payments,"* said Tomas Bartos, Peymo CEO.

*"On one side, merchants and booking platforms are looking for new revenue opportunities and more*

*flexible payment solutions through simple API integration. On the other side, millions of crypto holders are actively looking for seamless ways to spend their digital assets instantly in the real world.*

*PEYMO sits directly in the middle of those two worlds.*

*Our vision has always been to remove the friction between crypto ownership and everyday spending. We believe the ability to choose between paying with a traditional debit or credit card or paying with crypto at checkout will eventually become a normal standard across online commerce, hospitality, and global travel.*

*The technology should feel invisible to the merchant and effortless for the customer — and that is exactly what PEYMO is building.”*

### **About Peymo**

Peymo is an AI-powered hybrid banking platform designed to connect decentralised cryptocurrency with global financial infrastructure. The platform combines self-custodial wallets, QR crypto payments, Visa card programs, multi-currency banking, merchant payment gateways, and AI-driven financial tools — all within a single integrated ecosystem.
