

# Sweven Introduces Maintenance Infrastructure as a Service for Commercial Buildings

Monitors assets, coordinates execution, tracks compliance and expenditures, simplifies billing — and only surfaces to your team when action or decisions are needed.

**Lake Mary, Florida May 24, 2026 (IssueWire.com)** - Sweven announced the availability of Sweven FM, a Maintenance Infrastructure as a Service platform for commercial buildings, providing companies with a scalable operational layer that replaces disconnected vendors, spreadsheets, and reactive maintenance with one coordinated semi-autonomous maintenance operation.

Instead of relying on disconnected vendors, spreadsheets, reactive maintenance, and layers of internal coordination, Sweven provides a scalable operational layer that combines intelligent software, connected sensors, semi-autonomous workflows, digital payments, vetted service vendors, and Fractional Facilities Managers into one coordinated maintenance operation.

Sweven monitors assets, coordinates execution, tracks compliance and expenditures, simplifies billing, and surfaces operations to your team only when action or decisions are needed — allowing companies to run modern maintenance operations without building large internal departments or managing operational complexity manually.

Commercial operators are now running their maintenance operations through Sweven. The first to operate with this model have a structural advantage over those who arrive later — the operation is already configured, the vendor network is already in place, and the intelligence has already started working.

## About Sweven

Sweven enables semi-autonomous facilities management for commercial buildings — automating the

busywork, not the judgment. From a single service layer, companies fully or fractionally manage one site or an entire portfolio, covering operations, costs, and compliance, while accessing a built-in network of vetted vendors ready to execute the work.
