

The Packaging Company Launches Sustainable Airless Bottles for Skincare and Cosmetic Brands

New mono-material airless packaging line supports recyclable cosmetic packaging without compromising product protection.

Long Beach, California May 7, 2026 (Issuewire.com) - The Packaging Company Launches Sustainable Airless Bottles for Skincare and Cosmetic Brands

New mono-material airless packaging line supports recyclable cosmetic packaging without

compromising product protection.

The Packaging Company (TPC), a packaging company with wholly-owned operations in the United States and China, today announced the launch of a new line of sustainable airless bottles designed for skincare, nutraceutical, and cosmetic brands seeking recyclable packaging alternatives.

The product line includes mono-material airless bottle systems manufactured using 100% polypropylene (PP) construction to support compatibility with existing recycling streams.

Traditional airless pump bottles often combine multiple materials such as PET, ABS, metal springs, and polypropylene components, which can create challenges for recycling systems. TPC's sustainable airless bottle line is engineered using a single PP resin across the bottle body, piston, and pump components to support simplified recycling compatibility.

The product line is designed for formulations that require reduced air exposure, including serums, retinoids, peptide complexes, vitamin C formulations, and other active-ingredient skincare products. The airless dispensing mechanism helps reduce oxidation by limiting air contact during product use.

"Brands in the skincare and nutraceutical markets are increasingly evaluating packaging solutions that align with both sustainability initiatives and product performance requirements," said Thu Vu, VP of Sales at The Packaging Company. "Mono-material airless packaging allows brands to support recyclability goals while maintaining the protective performance expected from airless dispensing systems."

The expansion of the sustainable airless bottle line reflects broader industry movement toward recyclable and simplified packaging structures. The European Union's Packaging and Packaging Waste Regulation (PPWR), which establishes recyclability requirements for packaging sold in EU markets, has accelerated interest in mono-material packaging formats among beauty and wellness brands.

In the United States, sustainability-focused retailers and consumers are also increasing demand for packaging formats that can better align with existing recycling infrastructure.

TPC's sustainable airless bottle line is available in multiple volume configurations for serums, creams, lotions, and treatment formulations. The product line supports custom decoration options including screen printing, hot stamping, and custom color applications.

Key product specifications include:

- Construction: 100% polypropylene (PP) components
- Pump system: Vacuum-sealed airless dispensing
- Formula compatibility: Serums, emulsions, creams, and active formulations
- Decoration options: Screen printing, hot stamping, and custom colors
- MOQ: Starting at 5,000 units
- Recyclability: Designed for PP recycling compatibility

Integrated Supply Chain Structure

TPC operates with wholly-owned operations in both the United States and China, allowing the company to manage production coordination, quality control, and factory communication directly through its

internal teams. According to the company, this structure supports packaging development for brands requiring custom formats, technical documentation, and pre-production sampling.
