

The TDIT Group Builds and Launches Diggato, a Camera-First AI App for Collectors

Next-generation mobile platform uses OpenAI-powered vision and OCR to instantly catalogue and value collectibles from a single photograph.

The logo graphic for TDIT GROUP consists of a large, stylized letter 'D' shape. The 'D' is composed of three overlapping rounded rectangular sections: a pink section on the left, a dark blue section in the middle, and a light blue section on the right. The text 'TDIT GROUP' is centered horizontally across the middle of the 'D' shape.

TDIT GROUP

San Francisco, California May 12, 2026 ([IssueWire.com](https://www.IssueWire.com)) - The TDIT Group, a global Business & IT Services company specialising in AI-driven digital transformation, today announced the successful development and [launch of Diggato](#) — an AI-powered mobile application built for Hope Studio. Designed for the passionate world of collectors, Diggato is a first-of-its-kind 'camera catalogue for

anything' that allows users to capture, organise, and accurately estimate the value of their collectibles — including comics, vinyl records, rare books, and much more — simply by taking a photo.

From Fragmented Tracking to Instant Intelligence

For decades, collectors have relied on fragmented tools, manual cataloguing, and highly subjective valuations. Spreadsheets, price guides, and forum posts have been the industry standard — none of them fast, customizable, or scalable.

Diggato changes that entirely. By combining computer vision, AI-powered OCR, and contextual reasoning into one seamless mobile experience, the app enables collectors to instantly identify items, extract key details, and understand potential market value — all without a single keystroke. Whether it's a rare first-edition comic, a vintage vinyl pressing, or a signed hardcover, Diggato brings clarity and structure to collections that were previously impossible to manage at scale.

A Purpose-Built AI Stack for Real-World Performance

At the core of Diggato is a unified AI architecture engineered by The TDIT Group — deliberately consolidated to eliminate the latency, cost, and complexity common to multi-API solutions:

- **OpenAI Multimodal Model (Latest Generation)** — Handles image recognition, OCR extraction, and contextual reasoning in a single pass, removing the need for multiple APIs and delivering faster, more coherent results.
- **AI-Powered OCR** — Accurately extracts text from images across varied conditions — from worn book spines to reflective vinyl sleeves — with precision that generic tools can't match.
- **Flutter & Firebase** — Provides seamless cross-platform performance (iOS and Android) backed by real-time data sync, robust authentication, and enterprise-grade cloud infrastructure.

Built by Collectors, for Collectors

Unlike generic image-scanning tools, Diggato has been purpose-built around the realities of collecting. The AI has been trained and refined on real-world collectibles use cases — ensuring the results are not only accurate but genuinely useful to enthusiasts who care deeply about provenance, condition, and market value.

From cataloguing entire collections to tracking value trends over time, Diggato bridges the gap between cutting-edge AI capability and the everyday needs of a community that has never had technology built specifically for them.

“We’re focused on building technology that simply works. With Diggato, we’ve taken powerful AI — vision, OCR, and reasoning — and made it feel effortless for collectors. You just point, click, and understand what you have.”
