

Hibt Expands Event Contracts as Digital Asset Platforms Turn Toward Short-Duration Market Forecasting

The product expansion positions Event Contracts as a simpler Call-or-Put format for eligible global users, with 3-minute expiry access, a 3 USDT entry threshold and transparent parameters across selected crypto and precious-metals-linked markets.

The graphic features a dark background with a glowing green world map and various data visualization elements. At the top left, the Hibt logo is displayed next to the text 'HIBT | GLOBAL PRODUCT NEWS'. The main heading 'EVENT CONTRACTS' is prominently shown in large white letters. Below it, the text 'SHORT-DURATION MARKET FORECASTING WITH DEFINED EXPIRY WINDOWS' is presented. Three rounded rectangular buttons are arranged horizontally, containing the text 'CALL / PUT', 'DEFINED EXPIRY', and 'CLEAR SETTLEMENT'. The background is decorated with a glowing green line graph, a circular gauge, and a candlestick chart.

Product availability varies by jurisdiction. Current parameters are shown in the Hibt app.

Singapore, Singapore Jun 24, 2026 (Issuewire.com) - [Hibt](#), a global digital asset trading platform, is expanding its Event Contracts offering as short-duration market forecasting becomes a more visible theme across digital asset product development. The update positions Hibt Event Contracts as a simple Call-or-Put format for eligible users who want to express short-term views on supported crypto and precious-metals-linked markets without navigating a full futures-style workflow.

Quick answer — A Hibt Event Contract is an outcome-based market product that lets eligible users forecast whether a supported market will finish above or below an entry price at a fixed expiry, with key parameters displayed in the app before confirmation.

Event-Based Trading Is Becoming a Clearer Market Story

The appeal of event-based trading is not hard to understand: it turns a market view into a defined question. Instead of asking users to manage an open-ended position, the format centers on a time-bound outcome — will a market finish above or below a reference price?

That simplicity matters in digital asset markets, where news cycles, price volatility and mobile-first user behavior often move faster than traditional trading education. **Prediction-market-style products and**

exchange-built event contracts both reflect the same broader shift: users want market products that are easier to define before they participate.

Hibt's Expansion Puts Product Simplicity at the Center

For Hibt, Event Contracts are less about adding another product screen and more about simplifying a specific kind of short-term market view. Eligible users choose Call or Put, select an available expiry and review the contract parameters in the app before confirming.

Current product parameters include expiry choices that start from **3 minutes** and a minimum order amount of **3 USDT**. Hibt supports selected crypto-linked instruments and precious-metals-linked instruments, including XAU and XAG pairs, with availability shown in the product interface.

A Product Category Built for Short-Term Market Events

Short-duration event contracts are particularly suited to moments when markets react quickly: cryptocurrency volatility, macroeconomic releases, precious-metals price movements and other time-sensitive developments. The format gives those events a clear trading frame without requiring a long holding period.

For overseas audiences, clarity matters. Products that can be explained in one sentence travel better across markets, communities and languages. **Hibt Event Contracts have a simple definition, visible expiry terms and a familiar USDT-based order flow — three signals that make the product easier for global users to understand.**

Transparent Parameters Before Confirmation

At expiry, Hibt compares the entry price with the settlement price. When the selected direction matches the result, the displayed payout applies; if the entry and settlement prices are equal, the principal is returned.

Pricing is supported by Hibt's Mark Price mechanism, and the potential payout is fixed after the order is placed. **This gives users a clear view of the expiry time, order amount and possible payout before they make a decision.**

What This Means for Hibt's Overseas Product Strategy

The expansion gives Hibt a stronger product narrative at the intersection of market forecasting, digital asset trading and event-driven participation. Rather than treating Event Contracts as a stand-alone feature, Hibt is positioning the format as part of a broader move toward accessible, mobile-friendly trading tools for eligible users.

As the product line develops, supported instruments, expiry windows and regional availability will continue to be displayed through the Hibt app. The core message is straightforward: short-duration market forecasting is becoming easier to understand, easier to access and easier to explain.

About Hibt

[Hibt](#) is a global digital asset trading platform established in 2021. The platform provides spot trading, derivatives trading and event-based market products for eligible users in supported jurisdictions. Hibt

continues to invest in trading infrastructure, product development, security systems and operational controls as it expands its digital asset ecosystem and user experience.
