

# PriusMED releases updated medCLOUD 2026 platform for Enhanced Clinical Collaboration

Beta evaluation is now live with limited spots remaining

**Rolling Meadows, Illinois Jun 12, 2026 ([IssueWire.com](https://www.issuewire.com))** - PriusMED today announced the release of its updated medCLOUD 2026 clinical collaboration platform. This latest version introduces new features and performance enhancements driven directly by customer feedback from the ongoing medCLOUD beta evaluation program.

Prominent among the updates is a new, real-time encrypted chat feature designed to supplement the platform's multiparticipant videoconferencing connectivity. This allows users to instantly share attachments such as reference data, instructions, and uploaded images with all session participants.

Additionally, device-generated 12-lead PDF reports and 12-lead snapshots are now instantly available to all session participants while also being stored on the recording timeline. This update provides critical utility when using vital signs monitors that generate these reports, but lack the capability to stream 12-lead ECG in real time.

Tailored for Emergency Medicine (EMS), Mobile Integrated Health (MIH), and Hospital-at-Home (HaH) applications, medCLOUD offers a comprehensive suite of features designed to make clinical encounters successful, fast, and efficient. The platform features interactive clinical annotations, high-resolution low latency ECG streaming, instantly accessible snapshots and reports, and timestamped events stored directly on the recording timeline.

*“As we still have a few Beta Evaluation spots remaining for Q3 and Q4 2026, we invite interested parties active in pre-hospital (EMS/Fire) or post-hospital (MIH/HaH) to sign up on our website for an initial discovery session,”* said Michael Jahns, CEO of PriusMED.

*“An industry first, medCLOUD is changing the way outpatient medicine is practiced today,”* added Dan M. Mihai, President of PriusMED. *“By unifying a currently fragmented ecosystem, we provide a seamless, vendor-independent experience. The platform combines multi-participant audio and video telepresence with the real-time streaming and sharing of patient vitals alongside user- and system-generated annotations for immediate collaboration and subsequent review of all recorded sessions.”*

As the demand for efficient, remote clinical assistance continues to rise, the medCLOUD platform is uniquely positioned to elevate patient care and enhance operational effectiveness in critical situations. PriusMED invites healthcare stakeholders, emergency medicine professionals, and mobile integrated health teams to explore the advantages of these cutting-edge solutions.

For more information on the capabilities of medCLOUD or to request participation in our Beta Evaluation program please visit [www.priusmed.com](http://www.priusmed.com).

**About medCLOUD™** medCLOUD is a patented, real-time collaboration platform designed to stream, broadcast, and record audio, video, and live streaming patient vitals. By enabling interactive case annotations and comprehensive reviews of recorded sessions, medCLOUD makes possible multi-participant remote clinical assistance for first responders, nurses, and clinical assistants in the field.
