

DeNet Goes Public: Decentralized Storage Protocol Launches on Top of a 7-Million-User Ecosystem

DeNet Storage Protocol v4 is now publicly available, backed by a live network of 2,000+ storage node operators and 3 million mobile validators already operating in 194 countries.

Dubai, United Arab Emirates Jul 30, 2026 ([Issuewire.com](https://www.issuewire.com)) - DeNet today announces the public launch of Storage Protocol v4, making its decentralized storage infrastructure available to users worldwide. At launch, the DeNet ecosystem includes more than 7 million registered users, 2,000+ active Datakeepers providing storage capacity, 3 million Watcher Nodes validating data availability, and

participants across 194 countries.

The Protocol Is the Foundation. The Ecosystem Proves It Works.

DeNet Storage Protocol v4 is the infrastructure layer responsible for distributing, encrypting, verifying and retrieving data across a decentralized network. The protocol enables applications, storage providers and validation services to operate together as a unified decentralized storage ecosystem.

The first application powered by the protocol is DeNet Storage, a mobile app that allows users to securely store, manage and share files without relying on centralized cloud providers. Learn more at: <https://mobile.denet.app/>

Storage capacity is provided by Datakeepers — independent participants operating storage infrastructure across the network. Watcher Nodes create a decentralized mobile validation layer, continuously verifying that stored data remains available, intact and accessible.

The architecture is designed to support consumer storage, enterprise infrastructure and future AI workloads while allowing developers to build additional applications and services on the same decentralized foundation.

"DeNet Storage Protocol v4 is the result of nine years of engineering. Today we're opening that infrastructure to the public. More importantly, it launches with an ecosystem that's already operating at scale — millions of users, thousands of storage providers and a decentralized validation layer spanning 194 countries."

— Rafik Singatullin, Co-Founder of DeNet

About DeNet

Founded in 2017, DeNet is building decentralized storage infrastructure for the next generation of digital services. Its technology aggregates unused storage capacity from independent participants into a unified network, enabling secure and sovereign storage for consumers, enterprises and AI systems while allowing users to retain ownership and control of their data.
