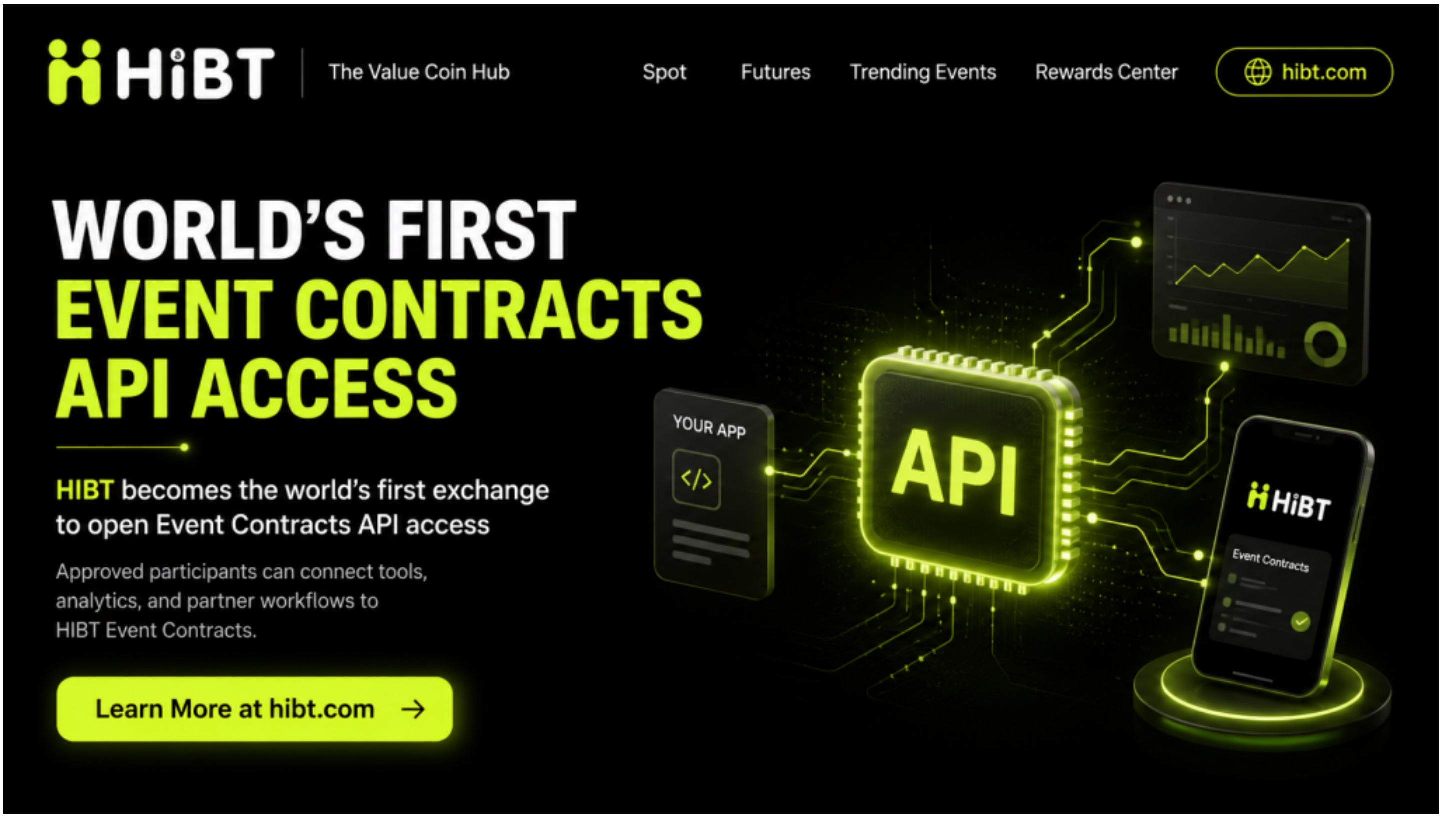
Hibt Becomes the World's First Exchange to Open Event Contracts API Access

The launch brings API connectivity to Hibt Event Contracts, extending market forecasting beyond the app and into approved trading tools, analytics platforms, and partner workflows.



Singapore, Singapore Jul 31, 2026 (Issuewire.com) - **Hibt** announced that it has become the world's first exchange to open **Hibt Event Contracts API** access, giving the platform a first-mover position in **event-based trading** and **short-duration market forecasting**.

Until now, most discussion around **Event Contracts** has focused on the app experience: choose a market view, select a time period, and wait for settlement.

Opening **Hibt Event Contracts API** changes that.

Instead of existing only inside the trading interface, **Event Contracts** can now connect with approved trading tools, analytics platforms, and partner workflows, allowing the product to extend beyond manual participation.

The timing is notable because **event-based trading** continues to attract traders looking for products built around defined outcomes and shorter trading windows. By introducing **Event Contracts API access**, Hibt is not simply adding another technical feature—it is expanding how the product can be used.

Event Contracts Move Beyond Manual Trading

Event Contracts allow eligible users to express a view on whether a market outcome will occur within a fixed period of time. The format is straightforward, making it accessible to a wide range of market participants while remaining well suited to fast-moving crypto markets where short trading windows often matter.

The introduction of Hibt **Event Contracts API** adds another layer to the product.

Until now, Event Contracts have primarily been accessed through the Hibt app, where trading takes place within a single interface. Opening API access allows approved participants to integrate **Event Contracts** into their own trading tools, analytics platforms, execution systems, and workflow solutions.

For everyday users, the trading experience remains unchanged. They can continue to choose a market, select a direction, and wait for settlement.

For approved developers, quantitative teams, and technology partners, however, API connectivity makes **Event Contracts** easier to incorporate into existing trading environments.

Rather than relying solely on manual execution, approved participants can integrate **Event Contracts** with their own trading tools, data platforms, and analytical workflows while remaining subject to Hibt's existing review process and risk controls.

A Clearer Place in the Market

The headline itself is straightforward: Hibt says it is the world's first exchange to open **Event Contracts API access**.

That gives the announcement a clear point of differentiation rather than positioning it as a routine platform update.

Beyond that claim, the launch also reflects how competition among cryptocurrency exchanges is evolving.

Exchanges are no longer competing on trading products alone. Infrastructure, developer tools, and product accessibility are becoming increasingly important as platforms look for new ways to support different types of traders and technology partners.

Opening **Event Contracts API access** gives the product a stronger foundation for future development. Instead of remaining a feature available only inside an app, **Event Contracts** can gradually become part of a broader ecosystem built around market data, trading tools, analytics, and workflow integrations.

Looking Ahead

Infrastructure rarely attracts as much attention as new trading products, but it often determines how those products evolve.

Opening **Hibt Event Contracts API** does not change how **Event Contracts** work.

It changes where they can be used.

As the **Event Contracts** ecosystem continues to grow, API connectivity creates more opportunities for integration, automation, quantitative research, and strategy development while supporting broader participation across approved trading environments.

Trading products evolve through new features.

Markets evolve through stronger infrastructure.

Hibt Event Contracts API is designed to support both.

About Hibt

Hibt is a global **digital asset trading platform** focused on crypto market products and trading tools for eligible users worldwide.

Through **Event Contracts**, the platform offers a market forecasting format that allows users to express views on defined market outcomes within fixed trading periods, subject to platform rules and regional availability.

The launch of **Hibt Event Contracts API** further expands the platform's infrastructure by enabling approved participants to integrate **Event Contracts** into external trading tools, analytics systems, and workflow solutions.
