

Miami, FL Certified Arborist Addresses Rising Tree Risks Amid Storm Seasons

MIAMI, FLORIDA — July 16, 2026 — A Miami, FL certified arborist with Green Wise Group is urging property owners to reassess tree safety as storm season intensifies across South Florida.

Miami, Florida Aug 7, 2026 (Issuewire.com) - As meteorologists predict another active hurricane season, a Miami, FL certified arborist from Green Wise Group is drawing attention to the rising risks posed by unmaintained trees and compromised root systems throughout South Florida. With frequent storms, high winds, and saturated soils, even mature trees can become structural hazards if underlying health issues go undetected.

Green Wise Group, a Miami, FL-based tree services and consulting company, reports an increase in calls related to fallen limbs, leaning trunks, and uprooted trees following heavy weather events. According to Founder Gene Sherwood, an ISA Certified Arborist with more than 30 years of experience in tree care and landscaping, many storm-related failures can be traced to preventable conditions such as decay, improper pruning, girdling roots, and soil compaction.

Storm stress often exposes weaknesses that have been developing for years and a comprehensive assessment before peak storm activity can significantly reduce the risk of property damage.

In South Florida's subtropical climate, tree species selection and maintenance practices play a critical role in storm resilience. Native and well-adapted species tend to demonstrate stronger wind tolerance, while improperly planted or poorly pruned trees may develop structural imbalances. As a consulting arborist serving Miami, FL, Sherwood frequently evaluates tree architecture, root health, and canopy density to determine vulnerability ahead of hurricane season.

Green Wise Group's tree services in Miami, FL include structural pruning, risk assessments, disease diagnosis, and pest management. The company notes that over-pruning or "topping" trees—common but outdated practices—can weaken structural integrity and lead to increased storm breakage. Instead, ISA standards emphasize selective pruning to promote balanced growth and reduce wind resistance without compromising long-term health.

In addition to residential properties, commercial sites across South Florida are reviewing landscape plans and tree inventories. As part of its consulting work, Green Wise Group collaborates with property managers, universities, and community organizations to evaluate large tree populations and prioritize mitigation strategies.

More information about the company's approach to arboriculture and storm preparation can be found at the company's official website: <https://greenwisegroup.com/>.

Sherwood, who also serves as a consulting arborist for the University of Miami and as an advisory board member of the Tropical Audubon Society, emphasizes that early intervention remains key. Detailed assessments conducted well before a storm warning allow time for corrective pruning, cabling, bracing, or soil improvements where necessary.

As South Florida enters the height of storm activity, Miami, FL tree services providers such as Green Wise Group continue to stress proactive planning. Property owners seeking background on professional standards and local expertise can review resources available at Green Wise Group's tree consulting page: <https://greenwisegroup.com/>.

For communities across South Florida, certified arborists say the focus should remain on safety, species suitability, and long-term tree health—factors that collectively help reduce storm-related risks in Miami, FL landscapes.
