

Quantum Agentix Launches Two Products to Make the Web Autonomous

Quantum Agentic Web and Quantum Agentic Websites debut together — an infrastructure layer for AI agents, and a platform where every website is an agent. Both are powered by Kai, the company's Quantum Agentic Intelligence (QAI).

San Francisco, California Jul 2, 2026 ([IssueWire.com](https://www.issuewire.com)) - **Quantum Agentix** today launched two products built on a single conviction: software should act, not wait. **Quantum Agentic Web** gives developers an infrastructure layer for autonomous AI agents that plan at quantum scale and act across the open web. **Quantum Agentic Websites** brings the same engine to everyone else — a platform where every site you launch is itself an agent that reads intent, personalizes, answers, books, and closes on its own. At the core of both is **Kai**, the company's **Quantum Agentic Intelligence (QAI)**.

The problem

For three decades, the web has been fundamentally passive. Pages load, render, and wait — leaving every unanswered question, every hesitant visitor, and every combinatorial decision to humans and brittle rules engines. As AI agents take on real work, the decision spaces they face explode faster than classical planners can search them, so today's agents prune, approximate, and time out. Quantum Agentix was founded to remove that ceiling.

Quantum Agentic Web

Quantum Agentic Web is an infrastructure layer for autonomous agents. It pairs every agent with quantum-accelerated planning — offloading the hardest combinatorial problems, such as routing, scheduling, allocation, and search, to hybrid quantum-classical solvers across QPU-agnostic backends — and secures every action with post-quantum cryptography. Developers deploy an agent, and it plans and acts across APIs and websites with sub-50-millisecond decisions and a signed, verifiable audit trail.

Quantum Agentic Websites

Quantum Agentic Websites puts that engine behind a browser tab. Instead of static pages, every website launched on the platform is an agent: it perceives who is visiting and why, personalizes in real time, and takes action — answering questions, booking meetings, recovering carts, closing sales — around the clock. Users describe the site they want in plain language; the platform generates the pages and the agent that runs them, then deploys to a custom domain in a single click. Early users report a median **+38% lift in conversion** from pages that optimize themselves.

Meet Quantum Kai:

Kai is not a chatbot, and not a copilot. "A Quantum Agentic Kai" is the company's term for a new class of agent — one that fuses large-model reasoning with quantum-accelerated planning and post-quantum-secure action. Where classical agents prune and approximate under time pressure, Kai weighs orders of magnitude more options before it acts — and cryptographically signs everything it does.

The same Kai runs beneath both products: it is the planner inside Quantum Agentic Web and the intelligence inside every site built on Quantum Agentic Websites.

"The bottleneck for autonomy was never intelligence — it was the size of the space an agent could search before it had to act. Kai changes the math. Whether you're wiring agents into critical infrastructure or launching a storefront over the weekend, you get an agent that thinks at quantum scale and acts with cryptographic trust. That's what the web has been missing."— Bo Gregorix, Co-Founder of Quantum Agentix, Quantum Web, and Quantum Agentic Websites.

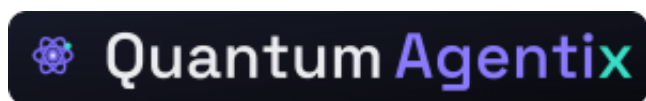

Availability

Both products are available today in early access. Quantum Agentic Web is opening to a first cohort of developer teams, and Quantum Agentic Websites is accepting waitlist signups from creators and businesses. Pricing will be announced at general availability.

"A page that waits is a page that leaks. We think the next decade of the web belongs to software that closes the loop itself — and Kai is how it gets there."— Bo Gregorix, Co-Founder, Quantum Agentix.

About Quantum Agentix

Quantum Agentix builds the infrastructure for an autonomous web. Its products — Quantum Agentic Web and Quantum Agentic Websites — let developers and businesses deploy AI agents that plan at quantum scale and act with post-quantum security, all powered by the company's **Quantum Intelligence, Kai (QAI)**.
