

TV-AGI - Making AI available to every Television Station

TV-AGI - the AI operating system for broadcast - lets any station program, produce, localize, and monetize its channel 24/7 with a single AI.

San Francisco, California Jul 26, 2026 ([Issuewire.com](https://www.issuewire.com)) - TV-AGI, today announced the general availability of the AI-native operating system for television. TV-AGI turns any station into an AI-native station: a single AI - Kai - runs programming, local news, advertising, captioning, translation, and personalization around the clock, across broadcast and streaming.

For decades, local stations have been squeezed between rising operating costs and shrinking staff - forced to do less television, on thinner schedules, for narrower audiences. TV-AGI is built to reverse that. Where a traditional station relies on a control room, a newsroom, an edit bay, a traffic desk, and a sales team, TV-AGI puts Kai in every one of those roles at once, running the station end to end while the station's people stay in control.

"We ran a real station first," said Bo Gregorix (Greg), Founder of ALIENTELLIGENCE. "TV30 proved that an AI can program, produce, and localize television end to end - at a scale and cost no traditional station can match. With TV-AGI, we're handing that same capability to every broadcaster in America."

TV-AGI includes:

- **Autonomous programming and playout** - Kai builds and runs the full 24/7 schedule in real time, with no gaps and no dead air.
- **AI local newsroom** - monitors the market and drafts local segments in minutes, so coverage scales with the community.

- **AI ad studio** - turns a business description into a broadcast-ready commercial, scripted, voiced, and cut in minutes, opening new revenue from local advertisers.
- **Real-time captioning and translation** - makes every show accessible across languages, out of the box.
- **Personalization and "Ask Kai"** - tailored recommendations and an interactive layer where viewers get answers woven into programming.
- **Analytics, compliance, and air-gapped deployment** - enterprise controls for stations that cannot compromise on security or governance.

"Local television doesn't need to shrink to survive - it needs to get smarter," Greg added. "TV-AGI lets a hometown station cover more of its community, in more languages, and open new revenue - all without growing headcount. That's how we keep free, local TV alive."

TV-AGI is available now to individual stations, station groups, FAST channels, and streaming networks through three plans - Launch, Broadcast, and Network - with cloud, on-premise, and fully air-gapped deployment options. Broadcasters can request a demo and pricing at alientelligence.com/tvagi.

ABOUT TV-AGI

TV-AGI is the AI-native operating system for television, built by ALIENTELLIGENCE and powered by its AI, Kai. It lets any station program, produce, localize, and monetize its channel 24/7 with a single AI, across broadcast and streaming. TV-AGI is the platform behind TV30, the first AI-native television station in the United States. Learn more at alientelligence.com/tvagi
