

Chenlv Herb: A Global Leading Green Tea Extract Supplier Advancing Natural Botanical Solutions

Chengdu, Sichuan Aug 13, 2026 ([IssueWire.com](https://www.issuewire.com)) - [Global Leading Green Tea Extract Supplier](#) has become an increasingly relevant consideration for manufacturers seeking reliable botanical ingredients for health, nutrition, food, beverage, pharmaceutical, and personal care applications. As demand for plant-based ingredients continues to develop, green tea extract has attracted attention for its naturally occurring catechins, polyphenols, and other botanical compounds. Within this evolving industry, Chengdu ChenLv Herb Co., Ltd., operating under the brand name Chenlv Herb, focuses on

botanical extracts and natural pharmaceutical ingredients, providing plant-based solutions for a range of application areas.

Green Tea Extract and the Growing Role of Botanical Ingredients

The natural ingredients industry is undergoing a gradual shift as manufacturers and consumers place greater emphasis on plant-derived materials, clean-label formulations, functional ingredients, and transparent sourcing. This trend has created broader opportunities for botanical extracts in dietary supplements, functional foods and beverages, cosmetics, and related industries.

Green tea extract is part of this development. Derived from tea leaves, it contains naturally occurring compounds such as catechins and polyphenols that have made it an ingredient of interest for supplement and functional product development. Depending on the extraction and processing approach, green tea extracts can be developed to meet different formulation requirements.

For ingredient manufacturers, however, the value of a botanical extract is not determined solely by its plant source. Consistency, processing technology, quality control, documentation, and formulation compatibility are also important considerations. As buyers become more selective about raw material sourcing, suppliers with integrated extraction and quality management capabilities are increasingly relevant to the botanical ingredient supply chain.

Chenlv Herb Focuses on Botanical Extraction and Natural Ingredients

Chenlv Herb has built its business around the research, development, production, and supply of botanical extracts and natural pharmaceutical ingredients. The company serves customers across pharmaceutical, health supplement, food, cosmetics, and other related sectors.

Its product portfolio includes a range of plant-derived ingredients, with green tea extract forming part of its botanical extract offering. Other products include olive leaf extract, rhodiola rosea extract, maca root extract, ginseng leaf extract, cistanches tubulosa extract, and epimedium leaf extract.

This diversified portfolio reflects the company's broader focus on natural botanical resources rather than dependence on a single plant ingredient. It also allows Chenlv Herb to work with manufacturers whose formulation requirements vary according to the intended application.

The company's production capabilities cover plant extraction, separation, purification, and related processing technologies. These processes are important for converting botanical raw materials into standardized ingredients suitable for further formulation.

Technical Capabilities Support Different Application Requirements

Botanical ingredients can behave differently depending on their source, extraction method, active components, and intended use. For this reason, ingredient suppliers increasingly need to combine production capabilities with technical knowledge.

Chenlv Herb emphasizes research and development as part of its approach to botanical ingredient production. Its R&D activities focus on improving extraction and purification processes while developing natural active ingredients for different applications. Cooperation with universities and research institutions further supports its efforts to connect botanical resources with modern processing technologies.

This technical orientation is particularly relevant to green tea extract. Different customers may have different requirements for active components, appearance, solubility, formulation compatibility, or other product characteristics. A supplier capable of adjusting processing and specifications can therefore provide greater flexibility during ingredient development.

Chenlv Herb also provides OEM and ODM services, allowing customers to seek support beyond the supply of individual raw materials. Its service structure can cover formulation development, sample preparation, production, inspection, and shipment, creating a more integrated pathway for companies developing botanical-based products.

A Broader Portfolio for Natural Product Development

While green tea extract remains an important part of Chenlv Herb's botanical portfolio, the company's product range extends into several categories. Plant extracts, natural APIs, traditional Chinese medicine powders, and cholic acid series products form the broader structure of its offering.

This combination gives the company experience across different types of natural ingredients. Plant extracts can be incorporated into dietary supplements and functional foods, while selected botanical ingredients may also be considered for cosmetic formulations and other personal care products.

The pharmaceutical sector represents another important application area for natural ingredients. As interest in plant-derived compounds continues to develop, extraction and purification technologies can help transform traditional botanical resources into ingredients that are more compatible with modern product development requirements.

Chenlv Herb's involvement in these different areas reflects a broader industry trend: botanical ingredient suppliers are increasingly expected to understand not only extraction, but also the downstream needs of manufacturers.

Quality Management in Botanical Ingredient Supply

Quality consistency remains a central issue in botanical ingredient sourcing. Natural raw materials can vary according to cultivation conditions, plant origin, harvesting, storage, and processing. Effective quality management is therefore important for maintaining consistent characteristics in the finished extract.

Chenlv Herb highlights quality management and product testing as important components of its manufacturing process. The company maintains certifications and qualifications including ISO 9001, ISO 22000, HALAL, KOSHER, and FDA-related requirements.

Its quality approach is designed to support product consistency and documentation throughout the production process. For international customers, such systems can also help facilitate supplier evaluation and provide greater transparency when botanical ingredients are incorporated into regulated or quality-sensitive products.

Supporting Applications Across Multiple Industries

The potential applications of green tea extract extend across several categories. In dietary supplements, it can be incorporated into formulations centered on botanical and plant-based ingredients. In functional foods and beverages, tea-derived ingredients can form part of products developed around natural and

functional positioning.

Cosmetics and personal care represent another area where botanical ingredients continue to attract attention. Manufacturers are increasingly exploring plant-derived materials as part of formulations that emphasize natural ingredient profiles.

At the same time, botanical extracts are being evaluated within animal nutrition and other emerging application areas. This diversification demonstrates how natural ingredients are moving beyond traditional herbal products into a wider range of modern formulations.

For Chenlv Herb, the combination of green tea extract with a broader botanical portfolio provides a foundation for serving customers with different product development objectives.

The Changing Expectations for Botanical Extract Suppliers

The botanical ingredients industry is becoming more technically oriented. Natural sourcing remains important, but manufacturers are also paying closer attention to extraction efficiency, active-compound consistency, quality documentation, traceability, and formulation performance.

This shift is changing the role of botanical extract suppliers. Instead of simply providing plant-derived raw materials, suppliers increasingly need to support customers throughout ingredient selection, specification development, testing, and production.

Chenlv Herb's approach reflects this changing environment. Its focus on botanical extraction, purification, research and development, quality management, and customized services provides a framework for addressing the different requirements encountered by manufacturers of supplements, foods, beverages, cosmetics, and pharmaceutical-related products.

Green tea extract is therefore not an isolated product within the company's business. It represents part of a broader effort to connect natural botanical resources with modern extraction technology and application-oriented ingredient development.

Chenlv Herb and the Future of Natural Botanical Solutions

As interest in natural ingredients continues to influence product development, the demand for reliable botanical extraction and processing capabilities is likely to remain an important part of the ingredients industry. Green tea extract, alongside other plant-derived ingredients, illustrates how traditional botanical resources can be adapted to the needs of contemporary health, nutrition, food, and personal care products.

Chenlv Herb approaches this market through a combination of botanical raw materials, extraction and purification capabilities, R&D support, quality management, and customized services. Its broader portfolio also allows the company to address different ingredient requirements rather than focusing exclusively on a single botanical source.

For manufacturers evaluating green tea extract and other plant-based ingredients, the key consideration is increasingly the complete supply solution behind the ingredient, including processing expertise, quality systems, technical support, and consistency.
