

Levaru Makes Digital Twins Standard for Every Managed Building

Facility management firm adds 3D walkthroughs, 360-degree documentation, QR-coded assets, and visual work-order tracking at no additional software cost.

Alexandria, Virginia Sep 3, 2026 ([IssueWire.com](https://www.IssueWire.com)) - Levaru, a facility management and commercial property services company serving Virginia, Maryland, and Washington, D.C., announced that every building under its management will receive a visual digital twin as part of its standard service.

The technology provides property owners with a digital record of their building, including 360-degree visual documentation, browser-based 3D walkthroughs, QR-coded equipment records, preventive maintenance schedules, and photo-documented work orders.

Instead of relying only on invoices, emails, and maintenance reports, owners can visually review building conditions, completed repairs, equipment locations, and ongoing service activity from a web browser.

“Property owners should be able to see what is happening inside their buildings, not simply receive an invoice and hope the work was completed correctly,” said Levaru. “Our goal is to provide greater transparency, accountability, and visibility into facility operations.”

Levaru’s digital twin system can document mechanical rooms, roofs, common areas, offices, and other building spaces. The 3D walkthroughs can also be shared with owners, lenders, insurers, brokers, tenants, and other stakeholders without requiring specialized software.

The platform connects directly with Levaru’s facility management operations. Technicians can scan QR codes on building equipment to access asset information and service history. Preventive maintenance schedules can generate recurring work orders, while tenants and property owners can submit service requests and monitor progress through an online portal.

Unlike many technology platforms that require separate software subscriptions, user licenses, or implementation fees, Levaru includes its digital building documentation and management technology as part of its facility management service.

The company says the approach is designed to make advanced building technology practical for everyday property operations while improving maintenance oversight, documentation, and vendor accountability.
