

Activate Fire Safety Strengthens Commercial Fire Protection Through Thorough System Inspections

Activate Fire Safety handles fire suppression system inspection and related fire protection requirements for commercial and industrial properties across Calgary, Edmonton, and surrounding Alberta communities.

Calgary, Alberta Sep 10, 2026 ([IssueWire.com](https://www.issuewire.com)) - Keeping fire protection equipment in working order is an ongoing responsibility for commercial property owners. Activate Fire Safety helps businesses manage that responsibility through scheduled inspections, maintenance, repairs, and documentation for a range of fire protection systems.

The company's [fire suppression system inspection services](#) cover equipment and systems commonly found in commercial properties, including sprinkler systems, kitchen fire suppression systems, fire extinguishers, fire alarms, emergency lighting, fire hydrants, fire hoses, and fire pumps. Activate Fire Safety also works with property managers on fire safety plans and related requirements.

Activate Fire Safety was established in 2004 and serves commercial and industrial properties throughout Alberta. Its inspection work is based on applicable NFPA standards and Alberta Fire Code requirements. The company identifies NFPA 25 for sprinkler systems, NFPA 10 for portable fire extinguishers, NFPA 17A for kitchen fire suppression systems, and ULC S536 for fire alarm systems among the standards relevant to its inspection services.

A major part of commercial fire protection is keeping inspection records up to date. The company uses BuildingReports for digital inspection documentation. Property managers can use these records to keep track of inspection results and deficiencies across their facilities.

The need for regular inspection can vary from one property to another. A restaurant kitchen, for example, has different fire suppression requirements from a warehouse or an office building. Activate works with restaurants and commercial kitchens, hotels, automotive and industrial facilities, warehouses, distribution centers, schools, and care and healthcare facilities.

Its service does not stop when an inspection identifies a problem. Activate Fire Safety also handles maintenance and repairs. The company says its service vehicles carry commonly required parts and equipment, allowing technicians to resolve many deficiencies during an inspection visit. Where the required parts or work are available, same-day deficiency resolution is included with its inspection service.

This approach also gives businesses an alternative to arranging separate contractors for each part of their fire protection program. Activate Fire Safety's CFAA-certified team can coordinate inspections and maintenance for multiple systems, while its digital reporting keeps the related documentation in one place.

Alongside fire system inspection services, Activate Fire Safety offers fire safety plan preparation and updates for commercial properties. Its fire safety plan service is designed to help property owners maintain the required documentation for their buildings and keep plans up to date as changes occur.

For businesses seeking fire protection services in Canada, the company's work focuses on inspection, maintenance, repair, and documentation rather than on a single piece of fire protection equipment. That

matters for facilities where several systems need to be inspected and maintained throughout the year.

About Activate Fire Safety

Activate Fire Safety was founded by Alan Reti in 2004 and provides fire protection inspection, maintenance, repair, and safety services for commercial and industrial properties. Its services include fire alarm and sprinkler inspections, fire suppression systems, extinguishers, emergency lighting, hydrants, hoses, fire pumps, fire safety plans, and other related safety equipment. The company serves Calgary, Edmonton, and surrounding Alberta communities.
