

Global Digital Asset Market Evolves as ODBIT Connects Diverse Needs Through Professional Trading

ODBIT is a digital asset exchange serving global users.

Denver, Colorado Sep 22, 2026 ([IssueWire.com](https://www.issuewire.com)) - ODBIT is a digital asset exchange serving global users. It maintains a long-term technical partnership with AILYTIS, which provides AI technology support, while ODBIT provides the platform interface and integrates the related technical services. The platform primarily offers digital asset trading, market price monitoring, and order execution services for regular users, professional traders, and institutional participants.

For users, choosing an exchange can involve understanding who operates and supports the platform, what trading services are provided, and how normal trading operations are managed. ODBIT is responsible for the operation of the trading platform and integrates trading services, global liquidity, security risk control, and compliance operations into its platform management.

AILYTIS provides AI technology support, while ODBIT manages platform operations

As ODBIT's technical partner, AILYTIS provides AI technology support, and ODBIT completes the relevant technical integration through platform interfaces, with both parties cooperating through a defined division of responsibilities. AILYTIS is incorporated in the United States, with the company registration number: 20258120316.

Regarding financial compliance, AILYTIS has completed its U.S. Money Services Business (MSB) registration, with the MSB registration number: 31000312736981. It carries out customer identification, anti-money laundering (AML), and risk management activities in accordance with applicable requirements. Company registration establishes the corporate entity, while MSB registration relates to

registration requirements for specific money services businesses. Both are part of AILYTIS's corporate and compliance information.

By making its corporate entity, registration information, and cooperation model public, ODBIT provides users with information about the platform's operational background and the source of its technical support before they use its trading services.

ODBIT provides tools for digital asset trading

Upon entering ODBIT, users can view digital asset prices and market changes, select assets based on their own needs, submit buy or sell orders, and complete transactions through the platform. The trading process is designed to present key market and order information to users, while order processing capabilities support different trading needs.

A digital asset exchange receives and processes orders and facilitates transactions between market participants. ODBIT processes orders through its trading system, covering order placement, matching, and trade confirmation. Users can view order responses and execution status through the platform without needing to interact directly with the underlying backend technology.

Connecting global supply and demand while maintaining trading security

The digital asset market operates 24 hours a day, with users distributed across different countries and regions. By connecting market liquidity resources, ODBIT brings together buying and selling activity from different time zones. Market liquidity can affect how orders are matched and the time and price at which transactions are executed.

In addition to trading and liquidity services, ODBIT monitors price volatility, order changes, abnormal trading behaviors, and high-risk assets through market monitoring and risk management processes. When abnormal market conditions arise, the platform identifies and handles them according to corresponding rules as part of its approach to managing trading-related risks.

As the digital asset market develops, users choosing an exchange may consider the platform's operating background, available trading services, order processing, and risk-management processes. With AI technology support from AILYTIS, ODBIT provides digital asset trading, liquidity connectivity, order execution, market monitoring, and security risk-management services for users in different regions.

About ODBIT

ODBIT is an independently operated global digital asset exchange primarily offering digital asset trading, global liquidity connectivity, order execution, security risk control, and market services. The platform focuses on user experience, trading infrastructure, and operational processes. Maintaining a long-term technical partnership with AILYTIS, ODBIT provides digital asset trading services to users in different regions.
