Lithosphere Strengthens Thanos as Agentic Wallet Layer for Human and Autonomous Onchain Activity

The AI-native Layer 1 ecosystem advances Thanos Wallet to support self-custodial access and emerging agent-driven interactions across decentralized Web4 environments.

London, United Kingdom Sep 14, 2026 (Issuewire.com) - Lithosphere is strengthening Thanos Wallet as an agentic wallet layer designed to support both human users and autonomous systems participating in onchain activity. The development expands the wallet's role within Lithosphere's Web4 ecosystem, connecting self-custodial asset management with infrastructure built for increasingly autonomous digital interactions.

Thanos Wallet provides users with direct control over supported digital assets while enabling access to decentralized applications and services across multiple blockchain environments. As Web4 systems evolve toward greater agent participation, the wallet's infrastructure is being positioned to accommodate interactions involving both user-directed actions and autonomous processes.

Within the broader Lithosphere architecture, Thanos operates alongside Lithic AI-native execution, PPAL persistent identity, DNNS decentralized naming and discovery, MultX cross-chain coordination, LEP100 standards, and LITHO utility. This connected framework brings wallet access together with the identity, execution, discovery, and coordination layers required for emerging agentic applications.

The development reflects a broader transition in wallet infrastructure as decentralized activity expands beyond conventional human-initiated transactions. By strengthening Thanos around agentic participation, Lithosphere is building an access layer capable of supporting users, applications, and autonomous agents across connected Web4 environments.

J. King Kasr, Chief Scientist at KaJ Labs, noted that wallet infrastructure must evolve as autonomous systems become more active across decentralized networks. According to Kasr, connecting self-custodial access with agent-ready infrastructure provides a stronger foundation for coordinated human and autonomous onchain activity.

About

Lithosphere is an AI-native Layer 1 blockchain platform developed by KaJ Labs to support intelligent decentralized infrastructure. Through Lithic, PPAL, DNNS, MultX, LEP100, LITHO, and ecosystem applications including Thanos Wallet, the platform supports scalable execution, persistent identity, cross-chain interoperability, and autonomous coordination for Web4 ecosystems.
