3.4, a Windows-based software designed to help users manage email conversion and migration tasks involving different mailbox formats, email clients, servers, and cloud services.

Email data is often spread across different applications and storage formats, particularly when organizations change email platforms or maintain archives from older systems.

Moving this data manually can require multiple applications and repeated export steps.

PCDOTS Email Converter brings these conversion requirements into a single Windows application, allowing users to load supported email data, review mailbox contents, select the required information, and save it to another format or destination.

One Tool for Different Email Sources

PCDOTS Email Converter Version 3.4 supports commonly used email formats including PST, OST, MBOX, EML, OLM, MSG, OFT, and DBX.

It also works with data associated with desktop email applications such as Outlook, Thunderbird, eM Client, Mailbird, Mailspring, Postbox, Windows Live Mail, and Eudora.

The software additionally supports selected mail servers and online services, giving users more options when working with email data from different environments.

Batch Processing for Large Mailboxes

Handling thousands of individual email files can be time-consuming when every message has to be processed separately.

Version 3.4 provides batch conversion capabilities that allow multiple source files or accounts to be processed as part of a conversion job.

Users can also apply folder and date-based selection before starting the conversion, which can reduce the amount of unnecessary data included in the output.

Review Email Data Before Conversion

Before saving the converted data, users can preview emails, folders, message headers, and attachments.

The preview option allows users to check the source mailbox and select the folders or messages they actually need.

This can be particularly useful when working with large archives where transferring the complete mailbox is not necessary.

Multiple Ways to Save Converted Emails

Different migration projects require different output formats.

PCDOTS Email Converter provides options to save email data as PST, MBOX, EML, MSG, PDF,

HTML, CSV, TXT, vCard, and ICS.

Users can also transfer email data directly to services such as Gmail, Microsoft 365, Yahoo Mail, iCloud, and other IMAP-compatible servers.

Filters Help Control the Conversion

A complete mailbox may contain years of messages, unnecessary folders, and attachments that users do not want to transfer.

PCDOTS Email Converter allows users to narrow their selection using filters such as date range, sender, recipient, subject, attachment size, and file type.

This gives administrators a way to prepare a more targeted output instead of converting everything stored in the source mailbox.

Useful for Email Migration and Data Management

The software can be used in several situations, including mailbox migration, email archiving, format conversion, data extraction, and movement between desktop email applications and cloud services.

For organizations working with legacy email archives, having support for several source formats in one application can also reduce the need to maintain separate conversion utilities.

PCDOTS Email Converter runs on Windows and does not require Outlook or an Office installation for its standalone conversion workflow.

About PCDOTS
