NBJM Expands Sustainable Fashion Lines As a Global Leading high-quality Garment Supplier

Ningbo, Zhejiang Nov 9, 2026 (Issuewire.com**)** - As global apparel brands increasingly prioritize sustainable sourcing, material innovation, and manufacturing reliability, **Ningbo Jinmao Import & Export Co., Ltd. (NBJM) is developing its position as a Global Leading high-quality Garment Supplier** through diversified garment collections, certified fabric options, and flexible production resources. Specializing in men's, women's, and children's clothing, the company combines garment development, OEM and ODM services, and supply chain coordination to address the changing requirements of international apparel markets. Its expanding sustainable fashion lines reflect a broader industry shift toward balancing product quality, functional design, and more responsible material selection.

Sustainable Fashion Is Reshaping Global Apparel Sourcing

Sustainability has become an increasingly important consideration in the international garment industry. Clothing brands and retailers are paying closer attention to raw material sourcing, manufacturing practices, product durability, and supply chain transparency. Rather than focusing exclusively on appearance and price, buyers increasingly evaluate whether garment suppliers can provide suitable materials and consistent production support while meeting specific environmental requirements.

Fabric selection plays a central role in this transition. Organic cotton, recycled polyester, and other alternative materials offer additional possibilities for developing apparel collections with different sustainability objectives. However, material selection must also account for softness, durability, breathability, appearance, and production compatibility.

For garment suppliers, this creates a need to integrate material sourcing with product development and manufacturing management. NBJM addresses these requirements through its long-term fabric supplier relationships and diversified manufacturing network, providing international customers with different options for developing apparel collections.

Diversified Garment Collections and Fabric Applications

NBJM specializes in knitted and lightweight woven garments, covering men's, women's, and children's apparel. Its product portfolio includes T-shirts, polo shirts, sweatshirts, hoodies, jackets, trousers, shorts, dresses, blouses, and other casual clothing. The company also supplies sportswear, including leggings, sports bras, athletic tops, and related garments.

These categories serve different market requirements, from everyday casualwear to activewear and seasonal clothing. For example, T-shirts and polo shirts are widely used in daily apparel collections, while sweatshirts and hoodies are suitable for casual and cooler-weather ranges. Sportswear requires additional attention to fabric stretch, comfort, and garment construction to accommodate movement.

To support these applications, NBJM offers a variety of fabrics, including single jersey, French terry, fleece, interlock, pique, rib, scuba fabric, coral fleece, Sherpa fleece, and polar fleece.

Each fabric has different characteristics and potential uses. Single jersey is commonly selected for lightweight tops, while rib fabrics provide stretch and are suitable for fitted garments and garment trims. Pique is frequently used in polo shirts, offering a textured surface, while French terry and fleece are suitable for sweatshirts and hoodies. Scuba fabric provides a structured appearance for selected fashion styles, and coral fleece and Sherpa fleece are used in soft-textured garments.

This combination of garment categories and fabric choices allows NBJM to coordinate product specifications with different customer requirements.

Expanding Sustainable Fashion Through Responsible Material Selection

An important part of NBJM's sustainable fashion development is its access to diversified fabric resources. Through long-term cooperation with fabric suppliers, the company can provide materials including Oeko-Tex-certified fabrics, BCI cotton, recycled polyester, organic cotton, Australian cotton, and Lenzing Modal.

These materials serve different purposes in apparel development. Organic cotton provides an alternative to conventional cotton, while recycled polyester allows recycled synthetic fibers to be incorporated into selected clothing products. BCI cotton supports sourcing aligned with the Better Cotton Initiative, and Lenzing Modal offers a soft textile option for garments where comfort and drape are important.

The availability of these materials gives brands greater flexibility when developing collections with specific fabric preferences or sourcing requirements. Buyers can discuss material composition, fabric texture, and intended garment applications before confirming production specifications.

Importantly, sustainable garment development involves more than choosing an alternative fiber. Fabric processing, dyeing, manufacturing efficiency, product durability, and transportation also influence environmental performance. Therefore, selecting appropriate materials and verifying relevant documentation are essential steps in responsible apparel sourcing. NBJM's cooperation with fabric suppliers and access to different certified material options provide a foundation for addressing these considerations.

Flexible Manufacturing Supports Different Apparel Requirements

A diversified garment collection requires manufacturing resources that can accommodate different styles, materials, and order quantities. NBJM maintains long-term cooperation with more than 30 partner factories across several regions of China. Its manufacturing network includes facilities of different sizes, enabling production arrangements to be matched with individual order requirements.

This flexible supply chain is particularly relevant to brands managing multiple clothing categories or seasonal collections. Different garments may require different production techniques, equipment, and material handling processes. Coordinating suitable factories helps connect product specifications with the appropriate manufacturing resources.

NBJM provides both OEM and ODM services. OEM production allows customers to manufacture garments according to their own designs and specifications. Through ODM services, customers can develop products with support from the company's independent design and technical teams.

Customers can provide sketches, photographs, or initial product ideas. The design team can then recommend suitable fabrics and coordinate design and production details. NBJM also operates a sample room supported by experienced pattern-makers and sample makers, whose average industry experience is approximately 20 years. This capability supports pattern development, sample production, and the evaluation of garment fit before bulk manufacturing.

Quality Management and Production Coordination

Maintaining consistent garment quality is essential when production involves multiple factories and fabric suppliers. Variations in measurements, stitching, fabric composition, color fastness, and finishing can affect the suitability of clothing for international retail markets.

NBJM has established a quality control team and regional production QC arrangements to monitor bulk manufacturing. For fabric procurement, its supplier relationships also provide access to third-party testing reports from laboratories such as SGS and BV. Relevant testing items include fabric composition, weight, color fastness, and tensile strength.

The company's partner factories hold various certifications and audit credentials, including BSCI, WRAP, Sedex, and Disney-related certifications. NBJM also holds ISO 9001:2015 and ISO 14001:2015 management system certifications, covering quality and environmental management.

These arrangements support the coordination of production requirements and provide buyers with a basis for reviewing relevant quality and compliance documentation.

Supporting International Brands With Customized Services

NBJM has served more than 100 brands and exported garments to over 30 countries and regions. Its

customers include large department stores, specialty stores, and supermarkets, which often require different combinations of product categories, materials, decoration techniques, and quality specifications.

The company's merchandising team plays an important role in coordinating these requirements. With an average working tenure of more than ten years, its merchandisers are familiar with fabric selection, printing, embroidery, product quality, and certification-related requirements. They also coordinate with suitable manufacturing partners according to individual order specifications.

NBJM offers printing and embroidery options to support product customization. Available techniques include digital printing, discharge printing, sublimation printing, heat transfer printing, puff printing, flat embroidery, patch embroidery, and other decorative processes. Fabric treatments and garment finishing options further allow selected products to be adjusted according to their intended appearance and wearing characteristics.

This combination of sourcing, development, and manufacturing coordination supports customers developing customized apparel collections for different retail channels.

Conclusion

The development of sustainable fashion requires coordinated decisions across material sourcing, garment design, production management, and quality control. As a **Global Leading high-quality Garment Supplier**, Ningbo Jinmao Import & Export Co., Ltd. brings together diversified clothing categories, access to certified and alternative fabrics, OEM and ODM development services, and a flexible network of manufacturing partners.

By connecting these capabilities with the requirements of international apparel brands and retailers, NBJM continues to expand its role in garment sourcing and sustainable fashion development.
