ProCore Capital Inc. Strengthens Security and Expands AI Research for Smarter Capital Services

Bardstown, Kentucky Nov 9, 2026 (Issuewire.com) - As global financial technology continues to evolve, artificial intelligence, big data, and digital infrastructure are transforming financial research, risk management, and capital services. With traditional finance and digital assets becoming increasingly interconnected, data security, system resilience, and intelligent research capabilities are emerging as essential foundations for sustainable development.

ProCore Capital Inc. (PCC), a U.S.-established international investment and capital management company serving global markets, continues to prioritize professional research, risk management, technological innovation, and disciplined operations.

In response to emerging developments across financial technology, the company plans to further strengthen its security infrastructure while increasing its research investment in artificial intelligence and related technologies.

Security remains a fundamental pillar of long-term development.

ProCore Capital plans to continuously enhance its comprehensive risk management framework, focusing on market, liquidity, credit, technology, operational, and data security risks.

Key areas of development include multi-factor authentication, access control, data encryption, abnormal access monitoring, system backups, and operational audits. These measures are intended to

strengthen information security and business continuity capabilities.

In customer management and data protection, the company emphasizes the principle of least-privilege access, with standardized controls covering the collection, storage, use, transmission, and deletion of sensitive information. It also continues to develop KYC, AML, and counterparty screening procedures to integrate security and compliance into its broader operational framework.

Artificial intelligence research is becoming an important direction for future technological development.

ProCore Capital plans to increase resources dedicated to AI research and application development, with particular attention to intelligent data analytics, market information processing, portfolio analysis, risk identification, and dynamic monitoring.

By exploring deeper integration between AI technologies and financial data systems, the company aims to improve information-processing efficiency, strengthen the identification of market developments, and provide more effective technological support for professional research and risk management.

The company emphasizes that artificial intelligence should serve as a research and analytical support tool rather than independently replace professional investment judgment.

Its development approach will combine technological assistance with human review, while paying close attention to model accuracy, data quality, algorithmic bias, and system security. AI applications should remain assessable, supervised, and manageable.

Looking ahead, ProCore Capital Inc. will continue investing in the development of security infrastructure, artificial intelligence research, financial technology, and global institutional collaboration.

By placing professional research at its core and risk management at its foundation, the company aims to advance toward a more intelligent, secure, and systematic capital services framework.

ProCore Capital Inc. — Building Trust Through Security. Advancing Research Through Technology. Connecting Global Capital Through Expertise.
